Dental Image plate scanner  
(Mochen PSP Scanner)

## NOTES

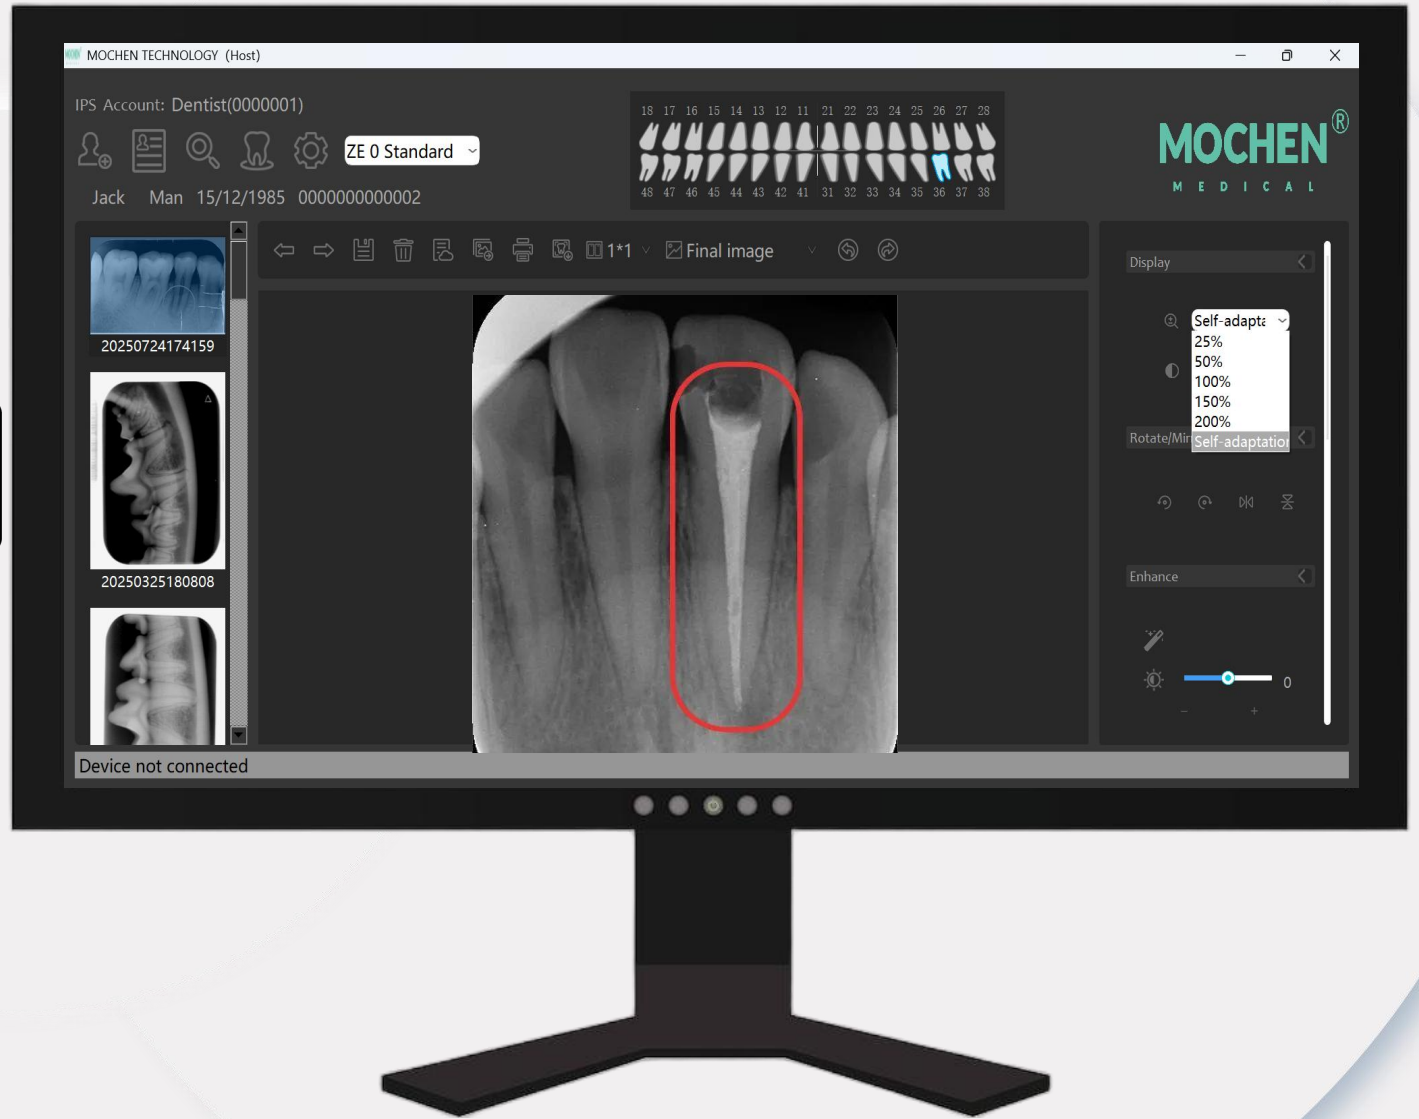

The dental image plate scanner, also known as a PSP scanner, is primarily used for periapical radiography of 1–4 teeth, enabling visualization of caries extent, periapical inflammation, and root canal filling quality.

## NOTES

The radiolucent area (black zone) circled around the root apex on the radiograph indicates periapical inflammation.

Root canal therapy is recommended to eliminate the source of infection .

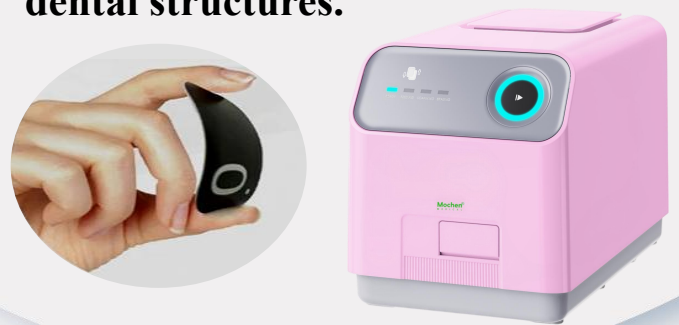

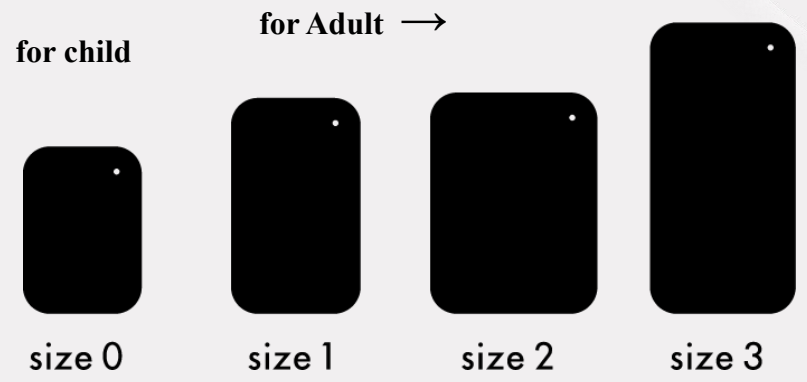

## NOTES

The radiopaque filling material within the tooth after root canal therapy indicates obturation quality. In this radiograph, the white filling material completely fills the root canal space, meeting the criteria for definitive root canal therapy.
